

PRESS RELEASE

La Chaux-de-Fonds, Switzerland, 24 March 2013

FKG Dentaire high performance Race instruments supplied in sterile blister packs.

In line with its strategy, FKG Dentaire launches its NiTi-Race rotary instruments on the market packaged singly and ready-for-use in sterile blister packs. Leading in innovation and safety, FKG Dentaire provides every endodontic treatment with the benefits of the latest techniques, top efficacy and optimum safety in use for dentists and patients.

The immense advantage of sterile instruments for the dentist is that apart from optimum hygiene (for example, the risk of cross-contamination is eliminated) a great deal of time is saved as they are supplied ready-for-use (consequently there is no need for handling, disinfection or sterilisation). It is essential that these nickel-titanium instruments are sterile as they are used by dentists for treating root canals.

The sterile versions of Race instruments are available in a full range with different lengths and complementary functions. Naturally, they retain all the benefits responsible for their great reputation throughout the world – in particular their unique non screwing-in design which avoids fracture of the file, an electrochemical polishing which increases the resistance to torsion and material fatigue, a safety tip which guides the file through the canal as well as unequalled cutting efficiency.

This Swiss company FKG Dentaire SA, founded in 1931, is at the forefront of development, manufacture and distribution of dental products for general dental practitioners, endodontists and dental laboratories. Precision has always been central to FKG, and the company naturally made its base in «Watch Valley,» home to most Swiss watchmaking and microtechnical companies.
